

20-303

Toyota Landcruiser LC5 amplifier bypass cable

InCarTec

Amplifier bypass cable for Toyota Landcruiser LC5 vehicles.

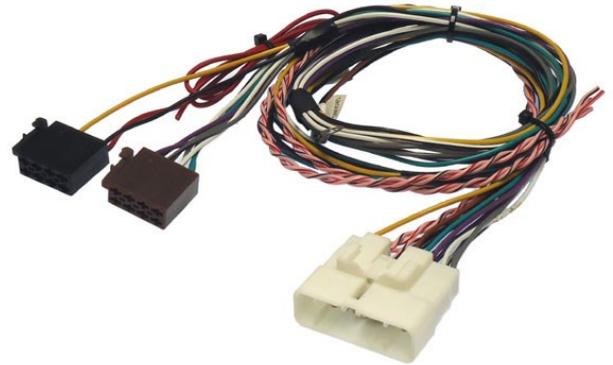

This cable is used to install a new aftermarket head unit and bypass the original amplifier in the car to play audio directly to the speakers in the car.

This cable connects to the ISO connectors at the new head unit in the dashboard, then extends under a front seat to where the original amplifier is, disconnect the amplifier and connect the white connector to the lead.

Connect the ring terminal on the “ground” wire to a good chassis ground.

Ignition power will need to be supplied to the new head unit, connect the loose red wire to a suitable power supply, we recommend a power supply from the fuse box or cigar lighter.

Additional pink wires are supplied on the 20-303 for the subwoofer, an additional amplifier will be needed to drive the subwoofer.
