

## 20-307

*Volvo XC90 amplifier bypass cable*

**InCarTec**

Amplifier bypass cable for Volvo XC90 vehicles.

This cable is used to install a new aftermarket head unit and bypass the original amplifier in the car to play audio directly to the speakers.

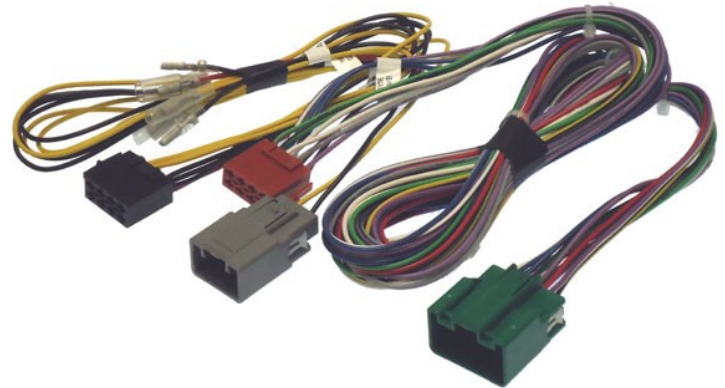

This cable connects to the ISO connectors at the new head unit in the dashboard, then extends under driver's seat (right hand drive) to where the original amplifier is.

Disconnect the green and grey connectors at the amplifier and connect to the 20-307. Run the 20-307 up through the dashboard to the new head unit. Connect the ISO connectors to the new head unit.

Extra wires in the green connector are supplied for the original subwoofer, an additional amplifier will need to be used to drive the subwoofer.

Note this lead has extra power and ground wires, these are to be used with a steering wheel control interface and a parking sensor retention interface (supplied separately).

This cable is normally supplied as part of a complete fitting kit, for more information see part number FK-860 on our website, [www.incartec.co.uk](http://www.incartec.co.uk)
